

E-Learning Platform Management System

Background

Advancements in technology have revolutionized the delivery of education and training by leveraging the internet, resulting in increased accessibility and flexibility in learning. The E-Learning Platform Management System maintains information related to both free and paid courses offered by companies and colleges, along with details about their respective instructors. Additionally, this database system maintains comprehensive student records, encompassing course enrollment, exam results, practice assessments, academic progress, rewards, achievements, certifications, and financial transactions, among other relevant data points. However, certain courses and training certifications are not accessible without a fee, requiring students to make a financial payment for enrollment. In our database system, we will implement a Rewards Points functionality which aims to motivate and incentivize students to pursue skills that genuinely interest them and use their accomplishments as a pathway to further learning, thereby assisting them in achieving their career aspirations.

Purpose/Objectives

- Establish a centralized and streamlined database to manage student records, course details, colleges, companies, and other relevant information.
- Implement a precise and transparent database for tracking and redeeming course points earned by students.
- Institute a comprehensive rewards system for course completion, which motivates learners by offering encouragement, recognition, and ongoing support for achieving certificates.
- Cultivate a collaborative student community, promoting idea sharing and peer-to-peer learning, while also facilitating access to advisors and trainers for learner assistance.
- Gather and assess feedback from both learners and instructors, utilizing this input to improve course quality, enhance the user experience, and refine teaching methods.

Scope

To distinguish themselves in a competitive environment crowded with peers, students must ensure they stay current and up to date. To keep up with the industry trends, one effective approach is to supplement their academic studies with knowledge gained from online platforms. With this system, we aim to address the potential financial constraints that students may face when considering enrolling in paid courses. The E-Learning Platform Management System is designed to introduce a unique Rewards Points functionality which enables students to access paid courses by redeeming accumulated points instead of making direct financial payments. The foundation of the Rewards Points functionality relies on the student records stored in our database, which continuously monitor their progress and are instantly updated upon the completion of any certification. As students earn more certifications, their profiles would earn additional reward points based on their performance in the exams or completion quizzes, which they can subsequently utilize for enrolling in paid courses. Hence, the E-Learning Platform Management System with this new Rewards Points functionality benefits students with affordable education for those eager to learn, motivating continuous learning, offering personalized paths, enabling real-time progress tracking, and enhancing career opportunities in this competitive environment.
